EDUCATION

Princeton University **Princeton, NJ**

B.S.E. Computer Science; Minors: Optimization and Quantitative Decision Science, Philosophy *Aug 2022 - May 2026*

SKILLS

- **Programming languages:** Python, JavaScript, Java, TypeScript, SQL, Assembly, Machine Code; C and C#; C++
- **Frameworks/Libraries:** PyTorch, TensorFlow.js, React, Node.js, Express.js, Three.js, OpenCV, Scikit-Learn, NetworkX, Pandas, NumPy, Socket.IO
- **Tools and Platforms:** Git, PostgreSQL, Docker, Azure / Azure AD, Heroku, Stripe API, Gemini API, OpenAI API, WebGL; Unity and Unreal
- **Technical Knowledge:** AI Agents, Retrieval/RAG, Agent Memory Graphs, Permission Enforcement, Ingestion Pipelines, Linux VM Computer Use, Credential/Login Automation, Computer Vision, Reinforcement Learning, Neuro-Symbolic AI, Network Analysis, Full-Stack Development, Real-Time/Gameplay Systems, Raycasting Physics, CNN Architectures

WORK EXPERIENCE

Contxt **San Francisco, CA**

Founding Engineer | Two-person team *August 2026 - Present*

- Added the permission layer and substantially modified ingestion to support agent memory while enforcing strict access permissions.
- Integrated Linux VM computer use into the agentic loop and updated the main agent loop to invoke desk sessions for computer tasks.
- Integrated and substantially modified Graphiti to build company and personal memory graphs that agents can retrieve from.
- Implemented credential management and agentic logins, including cookie and Chrome profile management.

Business Today **Princeton, NJ**

Assistant Director of Technology and Events at the 49th International Conference *September 2023 - January 2024*

- Coordinated technical infrastructure for the largest student-run undergraduate business conference in the U.S., accommodating hundreds of global attendees across tightly packed schedules.
- Managed and configured complex AV production systems, network infrastructure, and hybrid event software platforms. Collaborated closely with cross-functional design, operations, and speaker teams to engineer real-time streaming and interactive layouts.
- Ensured 100% uptime and flawless execution of hybrid event infrastructure under high-pressure, live deadlines, delivering a seamless experience for both on-site executives and international digital participants.

National Aeronautics and Space Administration (NASA) **Virtual**

Research Assistant *June 2021 - August 2021*

- Contributed to a fast-paced, nationwide, cross-disciplinary research initiative aimed at identifying and synthesizing emerging industry data to support mission-critical project objectives.
- Scaled data aggregation efforts by identifying, web-scraping, and filtering diverse online data sources. Employed analytical frameworks to clean, cross-reference, and synthesize unstructured data into actionable technical reports.
- Delivered comprehensive briefs ahead of schedule, enabling data-driven decisions and accelerating the project's overall development timeline.

Independent Contract Work **Charlottesville, VA**

Drywall Assistant *Summers 2021 - 2025*

- Supported residential drywall installation and finishing, including measuring, cutting, hanging, and applying joint compound to achieve smooth, paint-ready surfaces.
- Helped prepare job sites, organize materials, and adapt to on-site challenges to keep projects on schedule and meet client expectations.

PROJECTS

Blinding Lights: Enhanced Object Classification in High-Light Reflection and Overexposed Images
https://github.com/Lm7452/BrightNet
Developer | PyTorch, Scikit-Learn, CNN Architectures *December 2024*

- Problem: Standard computer vision models (like baseline ResNet) degrade rapidly in real-world edge cases involving severe overexposure, glare, and high-light reflections. These are important failure points for autonomous driving and robotics.
- Solution: Curated a custom, high-brightness image dataset simulating extreme exposure scenarios. Designed and trained BrightNet, a novel PyTorch CNN architecture integrated with custom attention mechanisms (ResNet+) to dynamically weigh spatial regions and suppress glare artifacts during feature extraction.

Happy Go LuckyMera: Neuro-Symbolic Reinforcement Learning for MiniHack
https://github.com/Lm7452/Happy-Go-Lucky-Mera
Developer | PyTorch, Reinforcement Learning, Neuro-Symbolic AI *May 2025*

- Problem: Traditional Reinforcement Learning agents struggle with sparse rewards, partial observability, and long-horizon planning, often failing to generalise or complete complex, multi-step sequential tasks.
- Solution: Reimplemented and optimized the LuckyMera hybrid framework, bridging the gap between connectionist and symbolic AI. Integrated neural behavioral cloning with a symbolic planner that reasons over high-level environmental rules to make logical decisions within MiniHack environments.

European Football Network Analysis: Premier League Transfer Market (1992–2021)
Developer | Python, NetworkX, Pandas, NumPy *May 2025*

- Problem: Evaluating a sports franchise's market influence and recruiting success is highly qualitative, lacking structural modeling of how money and talent flow globally across decades.
- Solution: Modeled 30 years of English Premier League transaction history by constructing a directed graph of 7,500+ historical player transfers utilizing NetworkX. Designed algorithms to calculate network centrality metrics (In-Degree, PageRank, Betweenness) to map club-to-club transaction weight and financial influence.

PulseAI: AI-Powered CPR Training Assistant
https://github.com/Samiksha-Gah/PulseAI-V2-
Developer | React, TensorFlow.js, Node.js, Computer Vision *November 2025*

- Problem: CPR saves lives, but self-directed learners lack real-time feedback on critical physical metrics i.e. compression depth, tempo, hand spacing.
- Solution: Engineered a real-time, browser-based computer vision platform utilizing TensorFlow.js for on-device pose estimation. Designed custom algorithms to calculate chest compression frequency and vertical displacement direct from a web camera, pairing the vision model with a multimodal, hands-free Gemini API voice coach to guide users dynamically.

UniEats: The Last 500 Feet of Campus Delivery
https://github.com/Lm7452/UniEats
Hosted: https://unieats-back-3813ec8fb7e1.herokuapp.com/
Developer | React, Node.js, Express.js, Socket.IO, PostgreSQL *September - December 2025*

- Problem: Standard food delivery services fail at the "last 500 feet" of college campuses because external drivers lack access to restricted-entry dorms, leading to cold food, missed handoffs, and lost revenue.
- Solution: Developed a hyperlocal campus delivery platform matching student orders with student couriers who have dorm access. Implemented real-time messaging and order-state synchronization with Socket.IO and a PostgreSQL schema to manage delivery chains. Coordinated a profitable student-run pilot with a delivery team; featured in The Daily Princetonian.

Deja Vu: A 2.5D Browser Game
https://github.com/Simothy03/dejavu-hosted
Hosted: https://simothy03.github.io/dejavu-hosted/
Developer | Three.js, JavaScript, WebGL *December 2025*

- Developed a 2.5D browser-based platformer using THREE.js, implementing custom raycasting physics and layer-switching mechanics to create 40+ challenging levels centered on "troll" game design.
- Achieved 60 FPS hardware-accelerated rendering directly in the browser with responsive, deterministic collision detection, delivering a highly fluid user experience without reliance on heavy external physics libraries.
